

InvenIQ

AI-Powered Inventory Intelligence

Built for the Laminates & Building Materials Trade

Industry Solution Brief

A focused look at how AI solves the laminates trade biggest operating problems

Document Type:	Solution Brief - Selected Capabilities
-----------------------	--

Industry Focus:	Laminates, Decorative Surfaces & Building Materials
------------------------	---

Modules Covered:	5 selected modules (of 37+ in the full platform)
-------------------------	--

AI Engine:	GPT-4o conversational + visual intelligence
-------------------	---

Prepared:	June 2026
------------------	-----------

CONFIDENTIAL - PREPARED FOR INDUSTRY EVALUATION

This brief covers a curated subset of modules. Full platform capabilities available on request.

What is InvenIQ?

InvenIQ is an AI-powered inventory intelligence platform for B2B distributors and manufacturers of building materials. It replaces spreadsheets and scattered registers with live operational dashboards and a conversational AI assistant (powered by GPT-4o) that understands your actual business data - stock, sales, distributors, and demand - and can answer questions, flag problems, and take action on it directly.

Why the Laminates Industry Needs This

- Huge SKU sprawl: hundreds of decor, finish, thickness and size combinations per brand make manual stock tracking unreliable at any real scale.
- Silent dead stock: discontinued decors and out-of-fashion patterns quietly lock up working capital for months before anyone notices the shelf has stopped moving.
- Dealer network complexity: multi-tier distributor schemes and volume-based discount slabs are negotiated individually and tracked in spreadsheets - slow to reconcile and easy to get wrong, which erodes dealer trust when payouts are late or incorrect.
- Demand volatility: decor and finish trends shift with interior design fashion cycles - without forecasting, businesses overstock fading patterns while bestsellers run out.
- Reporting lag: by the time a management report is compiled by hand, the numbers in it are already a week old.

The 5 Modules in This Brief

#	Module	What It Solves
1	Inventory & Dead-Stock Intelligence	Stop capital getting trapped in slow-moving decors
2	AI Demand Forecasting	Stock the patterns that will actually sell
3	Distributor Discount & Scheme Management	Run dealer schemes accurately, without spreadsheets
4	AI Photo-to-Catalog Product Search	Identify any sample or SKU in seconds, from a photo
5	AI Business Assistant	A 24/7 analyst that answers in plain English

Selected Modules - Detail

Module 1 - Inventory & Dead-Stock Intelligence

The Problem

With hundreds of decor/finish/thickness SKUs in circulation, most laminates businesses have no real-time view of what is actually moving versus what is quietly sitting in a warehouse corner. Capital stays trapped in slow-moving stock until a physical count finally surfaces it - often months too late.

How InvenIQ Solves It

- A SKU-level stock ledger records every movement - receipts, dispatches, returns and damage write-offs - so current stock position is always accurate, not estimated.
- An automatic dead-stock detection engine flags any SKU with zero movement beyond a configurable threshold (default 90 days) - no manual audit required.
- A live KPI dashboard surfaces Total SKUs, Total Stock Value, Items Below Reorder Level, and Dead-Stock Count at a glance, filterable by period (Today / MTD / QTD / YTD).
- The AI assistant can be asked directly - "which decors have not moved in 3 months?" - and answers instantly from live data instead of someone building a report.

Business Impact

Slow-moving decors get identified and cleared while they still have resale value, instead of becoming a write-off. Reorder decisions are based on real stock data, not guesswork or a warehouse manager's memory.

Module 2 - AI Demand Forecasting

The Problem

Decor and finish trends move with interior design fashion cycles. Ordering the wrong mix means warehouse space full of patterns nobody wants, while the decors customers are actually asking for keep running out.

How InvenIQ Solves It

- A built-in demand intelligence engine analyses real sales history to surface trend direction per product and category - rising, falling, or steady.
- Ask the AI assistant in plain English - "what should I stock more of this quarter?" - and get a live, data-backed answer instead of a gut-feel guess.
- A proactive insight engine flags demand spikes and slow decline automatically, surfacing the warning before a stockout or an overstock situation happens.

Business Impact

Fewer stockouts on bestselling decors, less capital trapped in fading patterns, and purchasing decisions grounded in actual demand signals rather than instinct.

Module 3 - Distributor Discount & Scheme Management

The Problem

Laminate brands sell through multi-tier dealer and distributor networks, each with individually negotiated volume-based schemes and discount slabs. Tracked manually in spreadsheets, this is slow to reconcile and easy to get wrong - and a late or incorrect payout damages a relationship that took years to build.

How InvenIQ Solves It

- A centralized discount engine maintains per-distributor pricing tiers, eligibility rules, scheme slabs and validity windows in one place.
- Full visibility into which schemes are currently active, which distributors qualify, and what is owed - replacing manual spreadsheet cross-checking entirely.
- Structured scheme management gives sales and finance teams the same numbers at the same time, eliminating the back-and-forth that normally happens at payout time.

Business Impact

Faster, accurate scheme payouts build dealer loyalty and protect the distributor relationships the business depends on. The sales team spends its time selling, not reconciling spreadsheets.

Module 4 - AI Photo-to-Catalog Product Search

The Problem

A customer walks in with an old sample, a competitor's sheet, or a photo from a magazine and asks "do you have this?" Manually flipping through a catalog of thousands of SKUs to find a match is slow, and often the sale is lost before the right product is found.

How InvenIQ Solves It

- Built-in AI visual recognition matches a photographed sample against the full product catalog and returns the closest matching SKUs with specification and stock status.
- Multiple photos can be searched in a single batch - useful when a customer brings several samples or a whole board of swatches at once.
- This visual-matching capability is already proven in the platform's hardware and sanitary catalog today, and the same underlying AI technique applies directly to matching laminate decors and sample swatches.

Business Impact

Sales staff identify the right product in seconds instead of minutes, at the counter or on a site visit - closing more sales before a customer walks away.

Module 5 - AI Business Assistant

The Problem

Getting a straight answer about the business - which customers are overdue, what the current stock position is, where margin is being lost - usually means waiting for someone else to pull a report together.

How InvenIQ Solves It

- A GPT-4o-powered assistant is built directly into the platform and understands live business data - ask it questions in plain English and get an instant, data-backed answer.
- It proactively surfaces problems on its own - stockouts, demand spikes, overdue payments - before anyone has to think to ask.
- It can take action directly from the conversation, such as drafting a purchase order, rather than just describing what should happen next.
- Responses stream back in real time, so the first answer appears in under two seconds.

Business Impact

Every manager gets an analyst on demand, 24 hours a day, without waiting on someone else to build a report - decisions get made the same day the question comes up.

Why InvenIQ - At a Glance

Problem	AI-Powered Solution	Business Outcome
Dead stock locks up capital	Automatic dead-stock detection + AI Q&A	Free up cash before write-off
Wrong decors in stock	AI demand forecasting	Stock what will actually sell
Slow, error-prone dealer schemes	Centralized discount/scheme engine	Faster, accurate payouts
Cannot match a sample to a SKU	AI photo-to-catalog search	Close sales in seconds, not minutes
Reports always a week late	Conversational AI assistant	Answers on demand, 24/7

This brief covers 5 selected modules as a focused introduction. The full InvenIQ platform includes additional capabilities across procurement, quality control, finance, freight, customer claims, and more - available for a deeper walkthrough on request.
